

R9 Anti-Collision Control

The R9 control system comes standard with Wittmann's Anti-Collision Control. In manual operation and dry cycles, The R9 control system activates its anti-collision controls. The control continuously monitors the power input of every single drive system. In the event of excessive deviations from standard values, which could indicate a potential collision with other work cell components, the drive system is shut off immediately.

Pairing Wittmann's Anti-Collision Control with Wittmann's Digital Twin will help ensure an error free and faster setup times.
